

Assignment: Build a Mini “AI Interviewer”

Create a small application that mimics a simplified version of the *Anthropic Interviewer* tool (more details here: <https://www.anthropic.com/news/anthropic-interviewer>). The goal is to design an interactive system that conducts short AI-powered interviews with users on a selected topic.

Requirements

- You may use any programming language, any LLM provider, and any framework you prefer.
- The UI can be terminal-based or a simple web interface.
- The application should:
 1. Allow a user to start an interview on a chosen topic (e.g., “AI in the workplace”, “productivity tools”, “scientific research”, etc.).
 2. Generate 3–5 sequential AI-generated interview questions based on that topic.
 3. Collect the user’s answers interactively.
 4. At the end, produce a brief AI-generated summary of the user’s responses (e.g., themes, sentiment, key points).
 5. Store the interview transcript and summary in a simple format (JSON, text file, or database).

Bonus (Optional)

- Perform basic analysis (e.g., sentiment scoring, keyword extraction).

What we’re evaluating

- Code clarity and structure
- Prompt design and LLM interaction
- User experience (even in a simple terminal)
- Your ability to build a small but polished AI-powered tool
